(54) VOICE REPRODUCING DEVICE

COPYRIGHT: (C)1999,JPO

(57) Abstract:

PROBLEM TO BE SOLVED: To easily find recording contents in optional order and time by retrieving the voice data agreeing with an inputted condition with a retrieval condition input means and successively outputting a retrieved voice file.

SOLUTION: When reproduction is performed, a main control circuit 6 reads out the data stored in a semiconductor memory part 10, and supplies them to a digital signal processing part 5 to expand them, and the voice data expanded by the digital signal processing part 5 are converted into an analog signal by a D/A converter 11, and is amplified by an AMP 12 to be outputted from a speaker 13 as a voice. In such a case, the main control circuit 6 judges whether or not the file agreeing with respective set conditional data exists by retrieving header information. Then, all parts having the priority being satisfied with the conditions are selected as reproducing objects. In such a case, a voice file unit isn't selected, but persistently, only the parts related to one mark positional information are selected.
